2024 California Walnut Objective Measurement Report

Pacific Regional Office · 650 Capitol Mall, Suite 6-100 · Sacramento, CA 95814 · (916) 738-6600 · www.nass.usda.gov/ca

Released: September 4, 2024 - 12:00 p.m. PDT

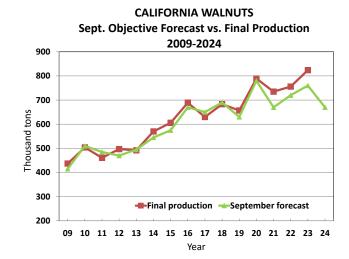

WALNUT PRODUCTION FORECAST DOWN

The 2024 California walnut production is forecast at 670,000 tons, down 19% from 2023's production of 824,000 tons. The forecast is based on 370,000 bearing acres, down 4% from 2023's estimated bearing acreage of 385,000.

The 2024 Walnut O.M. Survey utilized a total of 711 blocks with two sample trees per block. Survey data indicated an average nut set per tree of 761, down 24% from 2023's average of 1,004. Percent of sound kernels in-shell was 98.1% statewide. The average in-shell weight and dimensions for 2024 were: 21.1 grams, suture measurement was 32.5 millimeters, cross-width measurement was 33.4, and the average length was 38.4 millimeters.

The 2024 chilling hours were low. Several late winter and spring storms boosted the Sierra Nevada snowpack and significantly added to reservoirs bringing California to normal water conditions. Some instances of blight showed in walnut groves because of heavy spring rains. The summer brought record high temperatures to California and growers were forced to increase irrigation. Percent sound results from the Objective Measurement survey indicate nut quality will be decreased from last year.

Estimated nut sets, sizing measurements, average number of trees per acre, and estimated bearing acreage were used in the statistical models.

SURVEY HISTORY

The Walnut O.M. Survey began in 1958 to fulfill industry needs for an accurate walnut production forecast prior to harvest. The original sample was chosen proportionally to county and variety of bearing acreage. With each succeeding year, additions and deletions have been made in the sample to adjust for acreage removed, new bearing acreage, and operations that choose not to participate in the survey.

SAMPLING PROCEDURES

The 2024 Walnut Objective Measurement (O.M.) Survey was officially conducted from July 22 through August 22, 2024. There were a few samples completed before July 22 for training and scheduling purposes. There were 1,422 trees sampled from 711 orchards.

Once a block is randomly selected and permission is granted by the operation for enumerators to enter the block, two trees are randomly selected. An accessible branch is chosen which is 5-15 percent of the total cross-sectional area of the primary limbs and reachable with a twelve-foot ladder. Measurements are made on the trunk, each primary, and each split leading to and including the accessible branch. The sample tree and accessible branch are marked by a single tag, so that the same trees are sampled the following year if that orchard is selected. On the accessible branch, every nut is counted and the first of every five nuts is picked for use in size and grade determinations. If available, at least ten nuts are harvested from the accessible branch for this purpose.

The following measurements are made on nuts selected for sizing:

- 1. Weight of nut including hull
- 2. Width of shell at suture
- 3. Width of shell 90 degrees to suture line (cross-suture)
- 4. Length of shell
- 5. Kernel grade
- 6. Weight of nut in-shell

The Objective Measurement Survey is funded by the California Walnut Board.

DATA RELIABILITY

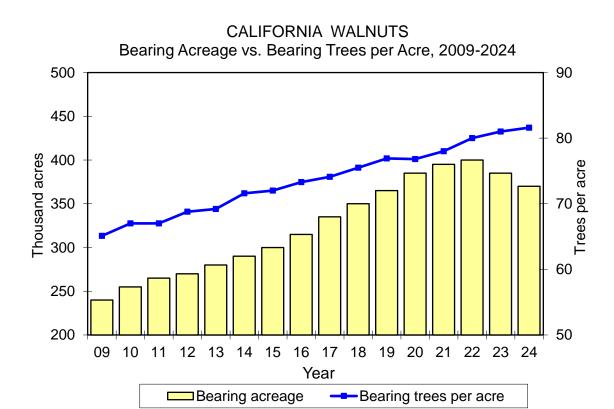

The 80 percent confidence interval is from 510,000 tons to 830,000 tons.

California English Walnut Acreage, Production, Price and Value In-Shell
